

**[CLAIMS]****[Claim 1]**

A dispenser with a sealed dispensing valve unit,  
which is secured to a mouth of a hermetic casing holding a  
5 cream-type cosmetic that is deteriorated by contact with  
air and has high viscosity, and discharges contents through  
a center of an upper plate of a button, when the button  
having a shape of a concave dish is pushed to operate  
pumping means provided under the button, the dispenser  
10 comprising:

an outlet hole bored in a concave central portion of  
the button, with an inclined inner surface defining a lower  
portion of the outlet hole and being tapered in a direction  
from an upper portion to a lower portion of the inclined  
15 inner surface, and a vertical inner surface extending from  
an upper end of the inclined inner surface to a  
predetermined height; and

a dispensing valve having at a lower portion thereof  
a funnel-shaped inclined outer surface to selectively come  
20 into contact with the inclined inner surface of the outlet  
hole due to operation of the pumping means, thus opening or  
closing the outlet hole, with a vertical outer surface  
extending upwards from an upper end of the inclined outer  
surface to a predetermined height.

25 **[Claim 2]**

The dispenser according to claim 1, wherein an outer diameter (d) and a height (t) of the vertical outer surface of the dispensing valve are smaller than an inner diameter (D) and a height (T) of the vertical inner surface of the outlet hole, so that some of the contents are filled between the vertical outer surface and the vertical inner surface, thus providing a sealing film.
